

MARKETING CAMPAIGN PERFORMANCE ANALYSIS REPORT

A 360° Data Analytics Portfolio Project

Prepared using Microsoft Excel and Power BI
Analysis Period: 12 November 2024 – 9 February 2025
Dataset: 1,000 Marketing Campaign Records | 25 Products | 5 Categories | 5 Channels

Prepared for: Business Stakeholders & Senior Management
Prepared by: Data Analytics Team

1. Executive Summary

This report presents a comprehensive performance analysis of a multi-channel marketing campaign program covering 1,000 individual campaigns run between 12 November 2024 and 9 February 2025. The analysis is built on an Excel dataset of campaign-level records and an interactive Power BI dashboard, and evaluates performance across advertising spend, reach, engagement, conversions, revenue, and return on ad spend (ROAS), broken down by product, category, marketing channel, and month.

Across the analysis period, the program generated ₹344.3 million in attributed revenue from ₹2.42 million in total ad spend, a blended ROAS of ₹142.51 for every rupee spent. The campaigns reached 242.5 million impressions, produced 12.3 million clicks (5.09% CTR) and converted 1.21 million of those clicks into sales (9.81% conversion rate), at an average cost of ₹9.97 per thousand impressions (CPM).

Performance is strong and broadly consistent across the portfolio, but not uniform. The Household category and the Instagram Ads and Referral channels stand out as the most efficient use of spend, while Personal Care and Email Campaign lag the portfolio average on ROAS. At the product level, Air Freshener, Eggs, Biscuits, Shampoo and Rice deliver the highest returns, while Toothpaste, Chips, Energy Drink, Milk and Chocolate deliver the lowest — a gap of roughly 3x in ROAS between the best- and worst-performing products. December 2024 and January 2025 were the strongest months for both spend and revenue, while November 2024 and the partial February 2025 window were comparatively lighter.

The key opportunity is reallocation, not expansion: the data supports shifting incremental budget toward the highest-ROAS channels, categories and products, applying the lessons from strong performers (notably Instagram Ads' low CPM and Household's high conversion rate) to underperforming segments, and investigating the five lowest-ROAS products before their next campaign cycle.

2. Business Problem

Marketing teams running campaigns across multiple products, categories and channels need a single, reliable view of where advertising budget is working and where it is not. Without a consolidated view, spend decisions are made channel-by-channel or product-by-product, making it difficult to compare efficiency on a like-for-like basis or to spot underperforming segments before budget is committed to the next cycle.

The Marketing Campaign Analysis Dashboard addresses this by consolidating all campaign records into a single interactive view. It allows stakeholders to:

- Monitor overall campaign performance (spend, revenue, ROAS, CTR, conversion rate) in one place.
- Track core KPIs against targets over time rather than campaign-by-campaign.
- Identify month-on-month trends in spend, reach and conversion efficiency.
- Compare category and channel performance on a consistent set of metrics.
- Identify the specific products driving — or dragging on — overall ROAS.
- Filter interactively by category to support day-to-day, self-serve decision-making.

3. Project Objectives

- Analyze overall marketing campaign performance across spend, revenue and conversions.
- Monitor advertising efficiency using CTR, conversion rate, CPM and ROAS.
- Track impressions, clicks and conversions as a funnel.
- Identify monthly performance trends across the campaign period.
- Compare revenue and efficiency across product categories.
- Compare profitability and efficiency across marketing channels.
- Identify the top- and bottom-performing products by revenue and ROAS.
- Provide interactive category-level filtering for deeper, self-serve analysis in Power BI.

4. Dataset Overview

The underlying dataset ("Marketing_Campaign dataset.xlsx") contains 1,000 campaign-level records across 11 columns, with no missing values and no duplicate rows. Each row represents a single tracked campaign for one product on one marketing channel on a given date.

Total records: 1,000 campaigns

Total columns: 11

Time period covered: 12 November 2024 – 9 February 2025 (spans four calendar months; February is a partial month of 9 days)

Products: 25, spanning 5 categories

Categories: Beverages, Groceries, Household, Personal Care, Snacks

Marketing channels: Google Ads, Referral, Instagram Ads, Influencer Marketing, Email Campaign

Column Descriptions

Column	Type	Description
Campaign ID	Text	Unique identifier for each campaign record
Product Name	Text	The product promoted in the campaign
Category	Text	Product category (5 categories)
Ad Spend (INR)	Numeric	Advertising cost for the campaign
Impressions	Numeric	Number of times the ad was displayed
Clicks	Numeric	Number of clicks the ad received
Conversions	Numeric	Number of clicks that resulted in a sale
Revenue (INR)	Numeric	Revenue attributed to the campaign
ROI	Numeric	Return on investment recorded per campaign
Campaign Date	Date	Date the campaign ran
Marketing Channel	Text	Channel used to run the campaign

This structure supports funnel-based analysis (impressions → clicks → conversions → revenue) and multi-dimensional comparison across product, category, channel and time — the four lenses used throughout this report.

5. Data Preparation

Before analysis, the dataset was reviewed and prepared in Excel as follows:

- Reviewed all 11 columns for consistent naming and correct data types (text, numeric, date).
- Checked for missing values across all fields — none were found.
- Checked for duplicate campaign records using Campaign ID — none were found; all 1,000 IDs are unique.
- Verified numeric fields (Ad Spend, Impressions, Clicks, Conversions, Revenue, ROI) contained valid, non-negative values consistent with a funnel ($\text{Conversions} \leq \text{Clicks} \leq \text{Impressions}$ in every record).
- Verified Campaign Date parsed correctly as a date field and confirmed the reporting window (12 Nov 2024 – 9 Feb 2025).
- Standardized Category and Marketing Channel as categorical fields with 5 fixed values each, to support consistent grouping in Power BI.
- Prepared the cleaned dataset as the single source table for the Power BI dashboard, with Category configured as an interactive slicer.

Note: Ad Spend and Revenue are both recorded in the dataset; “profit” and “profit margin” figures in this report are Revenue minus Ad Spend, calculated directly from those two fields. No separate cost-of-goods, customer-count or geographic-region fields exist in the source dataset, so this report evaluates profitability through ROAS/ROI and reads channel and category as the segmentation dimensions in place of geographic region.

6. Key Performance Indicators

₹2.42M Total Ad Spend	₹344.3M Total Revenue	242.5M Impressions	12.3M Clicks
1.21M Conversions	5.09% CTR	9.81% Conversion Rate	₹9.97 CPM
₹142.51 ROAS (per ₹1 spent)	1,000 Total Campaigns	25 Products	5 Channels

KPI	What it Measures	Why it Matters	Result & Interpretation
Total Ad Spend	Total investment across all campaigns	The budget baseline against which all returns are judged	₹2,416,146 across 1,000 campaigns; average spend per campaign of ₹2,416
Total Revenue	Sales value attributed to campaigns	Shows the top-line commercial return generated	₹344,327,040 attributed revenue — the largest single

KPI	What it Measures	Why it Matters	Result & Interpretation
			driver of the program's overall value
ROAS	Revenue generated per rupee of ad spend	The single clearest measure of campaign efficiency	₹142.51 revenue per ₹1 spent, with a healthy spread of 85.65–259.64 at product level
CTR	Clicks as a share of impressions	Indicates how compelling the ad creative/targeting is	5.09% overall — consistent across most months and channels (4.67–5.22%)
Conversion Rate	Conversions as a share of clicks	Indicates how well traffic converts once it lands	9.81% overall; Influencer Marketing (10.19%) and Household (11.25%) convert best
CPM	Cost per 1,000 impressions	A core efficiency measure for reach-based spend	₹9.97 average; Instagram Ads is the cheapest reach channel at ₹8.79

7. Ad Spend & Revenue Analysis

Spend and revenue moved together throughout the period, rising through the first three months and falling in the final, partial month:

Month	Ad Spend (INR)	Revenue (INR)	ROAS	Campaigns
Nov 2024	484,976	66,684,600	137.50	197
Dec 2024	821,202	118,774,900	144.64	331
Jan 2025	844,667	127,791,700	151.29	365
Feb 2025*	265,301	31,075,860	117.13	107

**February 2025 covers only 1–9 February and is not a full month; its lower totals reflect fewer days of activity, not necessarily weaker performance.*

December 2024 and January 2025 together account for 68.6% of total spend and 71.6% of total revenue, making them the clear peak of the program. ROAS also peaked in January 2025 (151.29), the strongest month for efficiency as well as scale — spend and efficiency grew together rather than trading off. The partial February window has the lowest ROAS (117.13) of the four months; this is worth re-checking once the full month of data is available, as an early dip combined with a short data window can look worse than the underlying trend.

8. Profitability (ROI) Analysis

Using Revenue minus Ad Spend as the profit measure, the program generated approximately ₹341.9 million in gross profit against ₹2.42 million in spend over the period — a reflection of Ad Spend being a small fraction of the Revenue figure recorded per campaign. Because no cost-of-goods or overhead data is included in the source file, this should be read as advertising efficiency (how much recorded revenue each rupee of ad spend supported), not a net business profit margin.

Viewed by channel, the pattern is consistent with the ROAS figures in Section 6:

Channel	Ad Spend (INR)	Revenue (INR)	ROAS	Conv. Rate
Instagram Ads	458,013	71,940,416	157.07	9.61%
Influencer Marketing	451,224	64,278,125	142.45	10.19%
Referral	516,511	73,302,728	141.92	9.96%
Google Ads	529,992	74,084,889	139.78	9.59%
Email Campaign	460,406	60,720,882	131.89	9.72%

Instagram Ads is the most profit-efficient channel (highest ROAS, lowest CPM at ₹8.79), while Email Campaign is the weakest, trailing the portfolio average ROAS by roughly 10 points despite receiving a comparable share of spend (19.1%). Referral and Influencer Marketing lead on conversion rate, suggesting the traffic each channel brings is well-matched to what converts, even where absolute ROAS differs.

9. Product Performance Analysis

Top 10 Products by Revenue

Product	Category	Revenue (INR)	ROAS
Cold Drink	Beverages	19,131,438	164.78
Biscuits	Snacks	19,018,967	195.07
Dishwasher Liquid	Household	18,879,220	160.13
Air Freshener	Household	18,282,739	259.64
Cooking Oil	Groceries	18,218,563	141.20
Garbage Bags	Household	17,637,811	139.07
Rice	Groceries	17,359,576	172.02
Floor Cleaner	Household	16,355,767	152.11
Shampoo	Personal Care	15,989,310	179.86
Eggs	Groceries	15,962,314	242.02

Bottom 5 Products by Revenue

Product	Category	Revenue (INR)	ROAS
Soap	Personal Care	10,219,475	140.18
Tea	Beverages	9,785,998	143.27
Toothpaste	Personal Care	9,681,481	85.65
Energy Drink	Beverages	9,545,945	95.29
Chips	Snacks	6,440,183	88.03

Household products dominate the top of the revenue and ROAS tables — 4 of the top 10 products by revenue, including the single highest-ROAS product in the portfolio (Air Freshener, 259.64). At the other end, Toothpaste and Chips combine low revenue with the lowest ROAS scores in the dataset (85.65 and 88.03 respectively), meaning they are underperforming on both scale and efficiency and warrant a closer look at creative, targeting or pricing before further budget is committed. Chips is a particular flag: it has both the lowest total revenue and one of the lowest ROAS scores in the portfolio.

10. Category Performance Analysis

Category	Revenue (INR)	Rev. Share	Ad Spend (INR)	ROAS	Conv. Rate
Household	82,826,148	24.05%	526,944	157.18	11.25%
Groceries	73,837,106	21.44%	488,856	151.04	9.98%
Beverages	63,351,715	18.40%	449,203	141.03	9.91%
Snacks	62,343,301	18.11%	458,080	136.10	8.87%
Personal Care	61,968,771	18.00%	493,063	125.68	8.88%

Household is the strongest category on every axis measured — the highest revenue share (24.05%), the highest ROAS (157.18) and the highest conversion rate (11.25%) — despite receiving a below-average share of total spend (21.8%). Personal Care is the clear laggard: it receives the second-highest share of spend (20.4%) but returns the lowest revenue share (18.0%) and the lowest ROAS (125.68) and conversion rate (8.88%) of the five categories. This combination — above-average spend, below-average return — makes Personal Care the category most in need of investigation.

11. Marketing Channel Performance Analysis

The dataset segments performance by marketing channel rather than by geography; channel is therefore treated here as the comparable dimension to a regional breakdown, since it is the axis on which the business allocates and can reallocate budget.

Channel	Revenue (INR)	Rev. Share	Spend Share	ROAS	CPM
Google Ads	74,084,889	21.52%	21.94%	139.78	10.49
Referral	73,302,728	21.29%	21.38%	141.92	10.59
Instagram Ads	71,940,416	20.89%	18.96%	157.07	8.79
Influencer Marketing	64,278,125	18.67%	18.68%	142.45	9.91
Email Campaign	60,720,882	17.63%	19.06%	131.89	10.12

Spend is fairly evenly split across the five channels (17–22% each), but returns are not: Instagram Ads converts an 18.96% share of spend into a 20.89% share of revenue — the best spend-to-revenue ratio of any channel, driven by its low CPM. Google Ads, by contrast, takes the largest spend share (21.94%) but returns a slightly smaller revenue share (21.52%) and the lowest ROAS among the top three channels. Email Campaign is weakest overall on both revenue share and ROAS despite a mid-pack spend allocation.

12. Monthly Sales Trend Analysis

Revenue grew each month from November through January before the (partial) February decline:

- Highest-performing month: January 2025 — ₹127.8M revenue, ₹844,667 spend, ROAS 151.29 (best of the four months).
- Second-strongest month: December 2024 — ₹118.8M revenue, ₹821,202 spend, ROAS 144.64.
- Lowest-performing month: February 2025 — ₹31.1M revenue, but only a 9-day window, so this is not directly comparable to full months.
- Growth trend: revenue rose 78.1% from November to December and a further 7.6% from December to January, before the data window ends.

The steady month-on-month growth through November–January, paired with rising rather than falling ROAS, indicates campaigns scaled up efficiently rather than simply spending more for the same or worse return. The dataset does not extend far enough (just under three full months) to confirm a seasonal pattern, so no seasonality claim is made here — this would need at least one additional year of data to validate.

13. Power BI Dashboard Overview

The dashboard is built as a single Power BI page titled “Market Campaign Analysis Dashboard,” combining a top-line KPI band, a category filter bar and four supporting visuals so a stakeholder can move from a headline number to the underlying trend or breakdown without leaving the page.

Dashboard Layout

- Top navigation bar: five category tabs — Beverages, Groceries, Household, Personal Care, Snacks — that filter every visual on the page at once.
- Left column, upper: “Spend vs. Conversion over a Time” area chart.
- Right column, upper: “Spend by Marketing Channel” donut chart with a channel legend.
- Left column, lower: “Sum of Ad Spend (INR) and Sum of Revenue (INR) by Date” combo chart (bars + line, dual axis).
- Center column, lower: “Impression and Clicks” horizontal bar chart by month.
- Right column, lower: eight KPI cards in a 2-column grid — Ad_Spent, ROAS, CPM, Clicks, CTR, Conversion, Conversion_Rate, Impression.

Because the category tabs act as a global slicer, every table below reflects the unfiltered, all-category view; selecting a single category (e.g. Household) would recompute all four charts and all eight KPI cards to that category alone — this is the dashboard's main self-serve capability for category managers.

1. KPI Card Band

Eight single-number cards give an instant health check of the whole program before drilling into any chart:

KPI Card	Dashboard Value	What It Confirms
Ad_Spent	2.42M	Total advertising investment across all 1,000 campaigns
ROAS	₹142.51	Revenue returned per ₹1 of spend — the headline efficiency number

KPI Card	Dashboard Value	What It Confirms
Conversion	1M	Total purchases attributed to the campaigns (1,210,118 exact)
Conversion_Rate	9.81%	Share of clicks that convert into a sale
Impression	242M	Total ad views delivered across all channels
Clicks	12M	Total clicks generated from those impressions
CTR	5.09%	Share of impressions that convert into a click
CPM	₹9.97	Average cost to deliver 1,000 impressions

Read top to bottom, the eight cards trace the full funnel in one glance — Impressions → Clicks (CTR) → Conversions (Conversion Rate) → Revenue relative to spend (ROAS) — with CPM and Ad Spend as the two cost anchors. This is the view a senior stakeholder checks first, before opening any chart, to confirm the program is still healthy.

2. Spend vs. Conversions Over Time (Area Chart)

Plots Ad Spend and Conversions on the same time axis for each of the four months, using two overlapping shaded areas so the gap between spend and conversions is visible at a glance:

Month	Ad Spend (INR)	Conversions	Spend-to-Conversion Ratio
Nov 2024	0.48M	0.23M	₹2.09 spent per conversion
Dec 2024	0.82M	0.40M	₹2.05 spent per conversion
Jan 2025	0.84M	0.46M	₹1.83 spent per conversion
Feb 2025*	0.27M	0.12M	₹2.25 spent per conversion

Business question answered: “does more spend translate into proportionally more conversions, or are we seeing diminishing returns as budget scales up?” The ratio actually improves from November to January (each conversion gets cheaper as spend rises), which is the visual evidence behind the “scaled up efficiently” finding in Section 12. A stakeholder uses this chart to sanity-check any proposal to increase monthly budget — it shows the last scale-up did not erode efficiency.

3. Ad Spend and Revenue by Date (Combo Chart)

Bars show monthly Ad Spend on the left axis (0–0.8M); the line shows monthly Revenue on the right axis (40M–120M), letting two very different scales share one chart:

Month	Ad Spend (INR)	Revenue (INR)	Implied ROAS
Nov 2024	0.48M	67M	≈ 140
Dec 2024	0.82M	119M	≈ 145
Jan 2025	0.84M	128M	≈ 152
Feb 2025*	0.27M	31M	≈ 115

Business question answered: “is revenue growth keeping pace with, or outpacing, spend growth?” The revenue line rises faster than the spend bars from November through January — visual confirmation of rising ROAS — before both drop together in the partial February window. This is the chart a finance stakeholder would check before approving a budget increase, since it shows revenue scaling ahead of cost.

4. Spend by Marketing Channel (Donut Chart)

A five-slice donut with a color-coded legend shows exactly how the ₹2.42M total spend splits across channels:

Channel	Spend (INR)	Share of Total Spend
Google Ads	529.99K	21.94%
Referral	516.51K	21.38%
Email Campaign	460.41K	19.06%
Instagram Ads	458.01K	18.96%
Influencer Marketing	451.22K	18.68%

Business question answered: “where is the budget actually going, at a glance?” The five slices are close to even (18.7–21.9%), which is the visual starting point for Section 11 — spend is almost evenly split, but as the ROAS-by-channel table there shows, revenue return is not, so this donut is best read side-by-side with a revenue-share view rather than alone.

5. Impressions and Clicks by Month (Bar Chart)

Horizontal paired bars show the top of the funnel for each month — total impressions delivered and total clicks generated:

Month	Impressions	Clicks	Implied CTR
Jan 2025	91M	5M	≈ 5.5%
Dec 2024	78M	4M	≈ 5.1%
Nov 2024	49M	2M	≈ 4.1%
Feb 2025*	25M	1M	≈ 4.0%

Business question answered: “is reach growing, and is engagement keeping pace with it?” Both impressions and clicks scale up together through January, and January's implied CTR is the strongest of the four months — reach did not just grow, it grew with better-than-average engagement. This is the chart a media planner would use to decide whether additional reach (impressions) is likely to convert to proportionally more clicks.

6. Category Filter Bar (Interactive Slicer)

Five tabs — Beverages, Groceries, Household, Personal Care, Snacks — sit across the top of the dashboard and act as a single global filter. Selecting one tab instantly recalculates all eight KPI cards and all four charts to that category alone, with no separate report or refresh needed.

Business question answered: “how is my specific category performing, right now, without waiting for a custom report?” This is what makes the dashboard a self-serve tool rather than a static snapshot — a Household category manager, for example, can isolate the KPI cards and trend charts to Household alone and see the same 157.18 ROAS and 11.25% conversion rate reported in Section 10, without needing an analyst to rebuild the view.

14. Key Business Insights

Insight 1: The program is efficient overall, generating ₹142.51 in revenue for every ₹1 spent, but that efficiency varies by roughly 2x across channels (131.89–157.07 ROAS) and over 3x across products (85.65–259.64 ROAS).

Business Impact: A portfolio-average ROAS can hide meaningfully underperforming segments that are quietly dragging down the overall number.

Recommended Action: Report ROAS at the channel and product level, not only as a single headline figure, in future dashboard reviews.

Insight 2: Instagram Ads has the lowest CPM (₹8.79) and the highest ROAS (157.07) of any channel, while receiving a below-average share of total spend (18.96%).

Business Impact: The channel is currently under-funded relative to how efficiently it converts spend into revenue.

Recommended Action: Trial a modest reallocation of budget from a lower-ROAS channel (e.g. Email Campaign) into Instagram Ads and re-measure ROAS after one cycle.

Insight 3: Household is the top category on revenue share (24.05%), ROAS (157.18) and conversion rate (11.25%), despite a below-average spend share (21.81%).

Business Impact: Household campaigns are converting exceptionally well for the budget they receive, making them a strong candidate for incremental investment.

Recommended Action: Prioritize Household products when allocating any incremental campaign budget next cycle.

Insight 4: Personal Care receives the second-highest spend share (20.41%) of any category but returns the lowest revenue share (18.00%) and the lowest ROAS (125.68) and conversion rate (8.88%).

Business Impact: This is the one category where spend and return are moving in opposite directions relative to the rest of the portfolio.

Recommended Action: Review Personal Care creative, targeting and channel mix before the next campaign cycle rather than increasing its budget.

Insight 5: Air Freshener (259.64 ROAS), Eggs (242.02) and Biscuits (195.07) are the three highest-ROAS products in the dataset, and all three sit in the top 10 products by revenue as well.

Business Impact: These products are proving that high efficiency and high scale are not mutually exclusive in this portfolio.

Recommended Action: Study what these three campaigns have in common (channel mix, creative, targeting) and test applying the same approach to lower-ROAS products in the same categories.

Insight 6: Toothpaste (85.65 ROAS) and Chips (88.03 ROAS) are the two lowest-ROAS products in the portfolio; Chips also has the lowest total revenue of all 25 products.

Business Impact: These two products are the least efficient use of ad spend in the entire program and are compounding that with weak scale.

Recommended Action: Pause or restructure the Toothpaste and Chips campaigns pending a review of creative and targeting before committing further spend.

Insight 7: December 2024 and January 2025 together account for 68.6% of total ad spend and 71.6% of total revenue, and January also has the highest ROAS (151.29) of the four months.

Business Impact: The program scaled its two biggest months without sacrificing efficiency — growth and ROAS moved together rather than trading off.

Recommended Action: Use November–January's spend and channel mix as the reference case when planning the scale-up of future campaign periods.

Insight 8: Referral (9.96%) and Influencer Marketing (10.19%) have the two highest conversion rates of any channel, ahead of Google Ads (9.59%), despite none of the three being the top channel on ROAS.

Business Impact: Conversion rate and ROAS do not always move together — a channel can bring highly qualified traffic without necessarily being the cheapest to reach.

Recommended Action: Evaluate channels on the combination of CPM, conversion rate and ROAS together, not on any single metric in isolation.

Insight 9: CTR is remarkably stable across the whole program, ranging only from 4.67% to 5.22% across all four months and all five channels.

Business Impact: Click-through performance is not the differentiator between strong and weak segments in this dataset — the gap opens further down the funnel, at conversion rate and ROAS.

Recommended Action: Focus optimization effort on post-click experience and offer/targeting rather than on ad creative aimed purely at improving CTR.

Insight 10: The February 2025 window in the dataset covers only 9 days and already shows the lowest ROAS (117.13) of the four months captured.

Business Impact: It is not yet possible to tell whether this reflects a genuine dip or simply an incomplete month of data.

Recommended Action: Re-run this analysis once the full month of February data is available before drawing any conclusion about a February slowdown.

15. Business Recommendations

- 1. Shift incremental budget toward Instagram Ads and Household products.** Both combine above-average ROAS with a below-average share of current spend, making them the most efficient place to deploy additional budget (Insights 2 and 3).
- 2. Investigate the Personal Care category before adding further budget.** It is the one category receiving above-average spend for below-average return; a creative, targeting or channel-mix review should precede any spend increase (Insight 4).
- 3. Review or pause the Toothpaste and Chips campaigns.** Both sit at the bottom of the portfolio on ROAS, and Chips also has the lowest revenue of any product — the weakest combination of scale and efficiency in the dataset (Insight 6).
- 4. Codify what is working in the top-ROAS products and test it on laggards.** Air Freshener, Eggs and Biscuits show that high efficiency and high revenue can coexist; documenting their channel mix and creative approach gives a concrete template to test on Toothpaste, Chips and Energy Drink (Insight 5).
- 5. Rebalance channel spend using CPM, conversion rate and ROAS together.** Referral and Influencer Marketing convert best, Instagram Ads reaches cheapest and returns most; blending these signals will give a more complete efficiency picture than ROAS alone (Insight 8).
- 6. Use the November–January period as the template for scaling future campaigns.** It is the only stretch in the dataset where spend, revenue and ROAS all grew together, and is the strongest evidence of what a successful scale-up looks like for this program (Insight 7).
- 7. Track the KPI set in this dashboard on a standing monthly cadence.** A recurring review of ROAS, CTR, conversion rate and CPM by category and channel will surface emerging under- or over-performers earlier than an ad hoc review.
- 8. Revisit February 2025 once the full month closes.** The current 9-day window is too short to confirm a genuine slowdown, and an early read risks triggering an unnecessary budget cut (Insight 10).

16. Conclusion

Overall, the marketing campaign program analyzed here is performing well: a blended ROAS of ₹142.51, a stable 5.09% CTR and a healthy 9.81% conversion rate all point to a program that is fundamentally sound. The main finding is not that the program is underperforming, but that performance is uneven across its component parts — by channel, by category and, most sharply, by product — and that this unevenness is currently invisible in the headline KPIs alone.

The clearest opportunities are the Household category and Instagram Ads channel, both of which are outperforming the spend share they currently receive, and the clearest risks are the Personal Care category and the Toothpaste and Chips products, all three of which are underperforming the spend or attention they currently receive. Neither the opportunity nor the risk would be visible from the top-line KPI cards alone — they only emerge once performance is decomposed by category, channel and product, which is exactly what the Power BI dashboard is built to do.

Going forward, the dashboard gives stakeholders a reusable, interactive tool rather than a one-off analysis: as new campaign data is added each month, the same six visuals and category filter will surface next month's opportunities and risks without any additional analyst work, supporting faster, evidence-based budget decisions on an ongoing basis.

17. Portfolio Project Summary

Project Name

Marketing Campaign Analysis — Business Performance 360° Dashboard

Tools Used

Microsoft Excel, Power BI

Business Objective

Consolidate 1,000 multi-channel marketing campaign records into a single interactive dashboard so stakeholders can monitor spend, reach, engagement and revenue efficiency, and compare performance across products, categories and channels without manual reporting.

Key Analysis

Cleaned and validated the campaign dataset in Excel (no missing values or duplicates found), then built a Power BI dashboard with KPI cards, a spend-vs-conversion trend chart, a spend-and-revenue-by-date combo chart, a channel spend breakdown, an impressions-and-clicks trend, and an interactive category filter.

Key Findings

The program returned ₹142.51 in revenue per ₹1 of ad spend overall, with Household and Instagram Ads outperforming their spend share, Personal Care underperforming its spend share, and a roughly 3x ROAS gap between the strongest product (Air Freshener) and the weakest (Toothpaste).

Business Value

The dashboard turns a static, campaign-by-campaign spreadsheet into a self-serve tool that lets any stakeholder identify where budget is working best — and where it needs attention — in a few clicks, supporting faster and more confident spend decisions each month.

18. Skills Demonstrated

- Microsoft Excel
- Data Cleaning & Validation
- Data Preparation
- Exploratory Data Analysis
- Power BI
- Data Visualization
- Dashboard Development
- KPI Development
- Business & Marketing Analysis
- Interactive Reporting
- Data Storytelling
- Business Insight Generation
- Data-Driven Decision Making
